

Reference materials for erectile dysfunction treatments

Following the commercial success of Viagra (Sildenafil) and, subsequently, Cialis (Tadalafil) and Levitra (Vardenafil), a range of other materials, including counterfeit products and analogue compounds, have appeared. These can be encountered either as pharmaceutical products, in powder or tablet form, or within 'herbal' materials, which have had undeclared chemicals added to them. Laboratories in the medicinal, forensic and toxicological sectors can therefore be faced with the task of identifying which, if any, of the many viagra-like materials are present in tablets, capsules, herbal materials or biological samples.

To assist these laboratories in their work, LGC Standards has brought together an extensive range of reference materials from a number of sources, including the three major chemicals, in both native and deuterated forms, together with a range of analogue substances and other compounds with 'viagra-like' effects.

We hope you will find the reference material you seek within our listing. If not, please contact us and we will endeavour to identify and obtain a suitable reference material for you.
